The Accuracy of Students' Novice, Apprentice, Proficient, and Distinguished Classifications for the 2025 Kentucky Summative Assessment (KSA) Tests

Background

The Kentucky Department of Education (KDE) has contracted with Human Resources Research Organization (HumRRO) to provide third-party quality assurance and validity studies to assist KDE in meeting its statutory responsibilities under Kentucky Revised Statute (KRS) 158.6453 and KRS 158.6455. Among the studies carried out annually, HumRRO independently calculates the accuracy of student classifications derived from assessments administered under the state accountability system. Classification accuracy is a method for considering the reliability of a test. This report presents the analyses for the 2025 Kentucky Summative Assessment (KSA) tests.

In spring 2025, Kentucky administered KSA for the fourth time. Students in Grades 3 through 8 and Grade 10 were tested in reading and mathematics. Science was assessed in Grades 4, 7, and 11. Social studies, editing and mechanics, and on-demand writing were assessed in Grades 5, 8, and 11.¹

Each grade/subject/form combination is treated as a separate test for scoring and reporting. Based on the results of these tests, each student is classified into one of four proficiency levels: Novice, Apprentice, Proficient, or Distinguished (NAPD). The percentage of students at each level contributes to schools' and districts' overall accountability ratings.

Grade/subject/form combinations included in the classification accuracy calculations are presented in Table 1. Scoring is a two-step process described in the KSA technical manual (KDE, 2024). Students first receive a scale score based on their responses to the test items. "Cut points" have been established to categorize student scores into NAPD performance levels. Performance level descriptors and associated cut scores indicate the mastery levels needed to be considered "on track" for college and career readiness.

Table 1. Grade/Subject/Form Combinations for the KSA Test Analyzed for Classification Accuracy

Subject	Grade 3	Grade 4	Grade 5	Grade 6	Grade 7	Grade 8	High School
Reading 10 forms/grade	X	X	X	X	X	X	X
Mathematics 4 forms/grade	X	X	X	X	X	X	X
Science 17 forms/grade		X			X		X
Social Studies 4 forms/grade			X			X	X
Editing and Mechanics up to 10 forms/grade			X			X	X

¹ We do not evaluate students' classifications for the 2025 KSA on-demand writing assessments as part of this research.

Methods and Results

The reliability of an observed test score is the product of two factors: true proficiency in the knowledge area being assessed and measurement error resulting from a variety of sources. Obtained scores are known, but true scores are unknown. Using test reliability-related statistics, however, it is possible to provide estimations that answer the following two questions:

- For a given obtained score, what are the odds that true proficiency is in the same NAPD classification?
- For that given obtained score, what are the odds that true proficiency falls into a different NAPD classification?

Classical Test Theory (CTT) is based on the concept of a “true” score for each examinee, defined as the expected or average score across an infinite number of repeated tests (see, for example, Lord & Novick, 1968). In most cases, we only have a score from a single administration of the test in question. The difference between this single “observed” score and the underlying “true” score is error. In the present case, we are concerned not only with the size of this “error” but also with its impact on classifying students into NAPD categories. Our concern is estimating the rate of classification error, defined as the probability that students could be classified in an NAPD category based on a single test administration other than the one in which their “true” score falls. Classification accuracy is typically used to denote the likelihood that a classification from observed scores agrees with the classification expected from true scores. The converse, which we will call misclassification, is the likelihood that a student’s true score is in a proficiency classification different from his/her observed score. The phrasing of this last sentence is important because it expresses errors meaningfully for individual students and their parents. Parents know their students’ test scores; information should be provided that helps them with the uncertainty about their students’ true proficiency based on those scores.

Test theory is concerned with the uncertainty of estimating students’ true achievement levels based on their fallible, observed test scores. Observed scores are assumed to vary in lawful ways around theoretical true scores or around domain scores, which are theoretical scores derived from all possible forms and conditions for measuring performance. This variation of observed scores around true or domain scores is calculated as the standard error of measurement (σ_e). In traditional reliability and generalizability theory, σ_e is a simple function of reliability (r_{tt}) and total test variability (σ_T):

$$\sigma_e = \sigma_T (1 - r_{tt})$$

Error bands around estimated scores often accompany reports of students’ test scores. These error bands are based on σ_e with the assumption that errors of measurement are normally distributed. Although σ_e reflects the variation of observed scores around true scores, because σ_e is constant across the scale of measurement, σ_e is also used to estimate the likelihood of true scores being within predictable intervals around observed scores. For students with a given observed score, the distribution of their true scores can be estimated by σ_e . For example, error bands may be constructed to show the interval around observed scores, which, with 95% confidence, should contain students’ true scores.

If score intervals are divided into proficiency levels, such as NAPD, then σ_e may also be used to estimate misclassification. That is, for any given estimated score, the probability that a student’s true score lies in the score interval of an adjacent proficiency classification can be estimated

from σ_e and normal distribution cumulative probabilities. An obvious implication of this is that the closer a student's observed score is to a cut point between two proficiency levels, the greater the chances that the student is misclassified. Indeed, the likelihood of misclassification approaches 50% for scores very near a cut point, regardless of σ_e .

Appendix B presents full data cleaning and analysis details. The following section provides an example to guide the interpretation of classification accuracy results.

Reading the Classification Accuracy Tables Using Spring 2025 KSA Grade 3 Reading Form 1 as an Example

In Table 2 and the similar tables in Appendix A, the numbers represent percentages of all students, so that the sum of all percentages of students by category is 100 (within rounding). The "Total % Assigned" row, located near the bottom of the table, indicates the percentage of students assigned to each of the four NAPD classifications. For example, in Table 2, 34.96% of all Grade 3 students who took the first form of the KSA in reading received test scores that placed them in the Novice category. Likewise, 29.09% of all students received test scores within the score range for the Apprentice category; 21.80% were Proficient, and 14.16% were Distinguished.

Table 2. Grade 3 Form 1 Reading 2025 Percentages of True Scores Being in Assigned Classification

True Class	Assigned Novice	Assigned Apprentice	Assigned Proficient	Assigned Distinguished	Total % Expected
Novice	30.00	4.98	0.02	<0.01	35.00
Apprentice	4.95	20.57	4.06	0.02	29.59
Proficient	0.02	3.53	15.20	3.07	21.82
Distinguished	<0.01	0.01	2.51	11.07	13.59
Total % Assigned	34.96	29.09	21.80	14.16	100

Note. Total % Correct Assignments = 76.84. Average Distribution Error = 0.28. Total % Proficient/Not Proficient Correct Assignments = 92.35.

Since test scores are not perfect, some proportion of students are expected to have true achievement in categories matching their assigned categories, while the remaining students are expected to have true achievement that falls in categories other than their assigned categories. The bold italicized numbers in Table 2 indicate proportions of accurate classifications. That is, 30.00% of all students are expected to be accurately classified as Novice, 20.57% of all students are expected to be accurately classified as Apprentice, 15.20% of all students are expected to be accurately classified as Proficient, and 11.07% of all students are expected to be accurately classified as Distinguished. The sum of these four percentages (76.84), or the "Total % Expected Correct Assignments," is the percent of all students expected to be classified accurately. That is, approximately 77% of all Grade 3 students would be assigned to the same reading proficiency category if we knew their true achievement.

Student classification accuracy data has important implications for school accountability scores. School accountability scores are a function of the classifications of all students. Some of the inevitable classification error will be in one direction and some in the other. As seen in Table 2, a proportion of students is expected to be classified as higher than their true proficiency, and another proportion as lower. The percentage of students actually assigned to a particular

category versus our projections of the percentage of students expected to have true achievement at that level shows that the misclassification errors tend to balance out for the total student population. For example, the last column in Table 2 shows that 29.59% of the students are expected to be classified as Apprentices based on their unknown true scores, while 29.09% of the students are assigned the Apprentice classification based on their test performance. The difference between these percentages is 0.5. For the other three categories, the assignment distributions are similarly close, with an average difference in category percentages of 0.28.

Accountability systems often report the percentage of students achieving proficiency and above. Thus, the accuracy of Proficient/Not Proficient classifications is particularly interesting. By summing all the italicized values in Table 2, we find that the accuracy of Proficient/Not Proficient classifications is 92.35%. Similar results tables for all included 2025 KSA grades/subjects are presented in Appendix A.

Summary of the Results

Table 3 presents the total expected correct assignments for all KSA grade/subject/form combinations in 2025, along with the results from the analyses of the 2012, 2019, 2021, 2022, 2023, and 2024 KSAs for illustrative purposes. In 2025, student classification accuracy varied from approximately 72.55% (Grade 7 mathematics) to approximately 79.78% (Grade 3 mathematics). Overall, mathematics has the lowest accuracy (76.23%). Several of the accuracy rates for the 2025 KSA are lower than those for the 2012 and 2019 summative assessment administrations, as would be expected, given that the test has been reduced in length over the years. However, we found that the results between the 2023 and 2024 KSA administrations showed comparable performance. When comparing 2024 to 2025, results were mixed across grade levels and subjects, with some subjects demonstrating increases in the percent of expected correct classifications, while others showed decreases. Notably, editing and mechanics demonstrated improvements across all grades, with increases in grades 5 and 11 from 2024 to 2025.

Turning from the individual level accuracy data to the distribution accuracy results, the seven right-most columns in Table 3 summarize how well the distribution of assigned classifications matches the expected distribution of true classifications by showing the difference between expected and assigned total percentages averaged across the four achievement levels. As would be expected, this average error is larger among the subject areas with lower accuracy.

The classification accuracy rates of 73-80% across subjects provide strong evidence in support of the validity of the NAPD achievement classifications. These results demonstrate that the assessments effectively place students in the appropriate achievement categories, allowing schools and districts to make informed decisions based on the data. Despite test length reductions over time, the accountability system remains built on trustworthy data that maintains acceptable levels of accuracy. Stakeholders can therefore place appropriate confidence in these results when evaluating student performance and school effectiveness.

Table 3. Total Percent Expected Correct NAPD Classifications and Average Category Distribution Error with Comparison Data from 2012, 2019, 2021, 2022, 2023, 2024, and 2025

Notes. % Correct = percentage expected to be correctly classified. Dist. Error = average category distribution error. Average Distribution Error is the average of the differences between the expected and assigned percentages across the NAPD categories. High school mathematics and reading were not included in the 2012 and 2019 analyses. High school science was not included in the 2012 analysis. Additionally, social studies, editing, and mechanics were not included in the analyses for 2012, 2019, and 2021. 2019 and 2021 science values are averages across forms. Finally, the values for each subject from 2022 to 2025 are averaged across forms.

MA = Math, SS = Social Studies, RD = Reading, EM = Editing and Mechanics, SC = Science

Discussion

HumRRO has independently calculated classification accuracy rates for Kentucky's annual summative assessments since 2000, using a methodology developed by Hoffman and Wise (1999) that was approved by Kentucky's National Technical Advisory Panel on Assessment and Accountability (NTAPAA) and presented at the annual meeting of the National Council on Measurement in Education (NCME; Hoffman & Wise, 2000). This method is unique in that it examines errors within each NAPD category rather than across all categories and uses the actual number of students classified in each category as part of the calculation. The KSA test vendor Pearson also calculates the accuracy of students' NAPD classifications as part of the annual KSA technical report (KDE, 2024). Using the method described in the technical report, HumRRO independently calculated classification accuracy rates and was able to replicate Pearson's results within a reasonable level of precision. Both methods yielded results supporting the reliability of students' NAPD classifications and the validity of their use in the school accountability model.

Appendix B. Data Cleaning and Analysis

Item-level data from the 2025 KSA administration were provided by KDE, in addition to student-level data for each subject test. For the purpose of our analyses, it was only necessary to analyze item-level data (e.g., item-level scores for Reading, Math, Science, Social Studies, and Editing and Mechanics, and a form variable indicating the administered test form) for operational test items. Reading and Math were assessed in Grades 3-8 and 10. Science was assessed in Grades 4, 7, and 11. Social Studies and Editing and Mechanics were assessed in Grades 5, 8, and 11. Raw cut scores were also provided and can be found for each performance classification in bolded font by subject, grade, and test form in Table B-1 below.

Data were cleaned and analyzed using RStudio for R version 4.1.1717. To begin the data cleaning process, item-level data were read into R in Excel format using the *read.xlsx* function of the *openxlsx* package. Data were then filtered to focus on a single subject, grade, and test form (where applicable) at a time. Non-responses were recoded as missing, and rows with all missing data were filtered out of the data frame. Based on the individual item score variables, raw sum scores were then calculated for each student's subject test using the *rowSums* function of the *dplyr* R package. At this point, the Standard Deviation (SD) of the raw sum scores for each subject, grade, and test form could be calculated.

Next, a separate data frame was created for the subject, grade, and form of interest, including only the individual item score variables. Cronbach's alpha (α) was then calculated using the *cronbach.alpha()* function of the *ltm* R package. The Cronbach's alpha calculations were not standardized and were calculated using the following formula:

$$\alpha = \frac{p}{p-1} \left(1 - \frac{\sum_{i=1}^p \sigma_{y_i}^2}{\sigma_x^2} \right)$$

where p is the number of items, $\sigma_{y_i}^2$ is the variance of the i th item, and σ_x^2 is the variance of the observed total test scores.

Classification accuracy was measured via a series of calculations in Excel. The first calculation, a pseudo z-score, was based on the individual raw sum scores or *observed scores*, the minimum and maximum values of the raw cut score ranges for each performance classification, and the Standard Error of Measurement (SEM) that was calculated using the SD and Cronbach's alpha values that were previously calculated in R. For reference, these raw cut score ranges are provided by subject, grade, and form in Table B-1 below.

Table B-1. 2025 Raw Cut Scores Ranges by Subject, Grade, and Form

Note. Cut scores within a subject may differ by form. The bolded font represents the specific raw cut score for the given performance classification.

MA = Math, SS = Social Studies, RD = Reading, EM = Editing and Mechanics, SC = Science

For each combination of the individual raw scores and the minimum or maximum values of the raw cut score ranges, the following z-score was computed:

$$z = \frac{X_{cs} - X_i}{SD\sqrt{1 - \alpha}}$$

where X_{cs} is the minimum or maximum value of a specific raw cut score range and X_i is the individual raw sum score. The denominator, $SD\sqrt{1 - \alpha}$, is the SEM calculation where SD is the standard deviation of the raw sum scores, and Cronbach's alpha (α) is the reliability estimate for the set of individual item scores for a given subject, grade, and form.

These values indicate the number of standard errors between the minimum or maximum value of the specific raw cut score range and the individual raw score and place the differences on the same scale. Negative values reflect raw scores above the cut score, and positive values reflect raw scores below the cut score.

For example, a table with sample calculations for Math Grade 3 Form 1 is provided below.

Table B-2. Sample Z-Score Calculations for Math Grade 3 Form 1

Raw Score	SEM	Nov Min	Nov Max	App Min	App Max	Prof Min	Prof Max	Dist Min	Dist Max
0.00	2.78	0.00	5.39	5.75	8.27	8.63	11.50	11.86	14.38
1.00	2.78	-0.36	5.03	5.39	7.91	8.27	11.14	11.50	14.02
2.00	2.78	-0.72	4.67	5.03	7.55	7.91	10.78	11.14	13.66
3.00	2.78	-1.08	4.31	4.67	7.19	7.55	10.42	10.78	13.30
4.00	2.78	-1.44	3.95	4.31	6.83	7.19	10.06	10.42	12.94
5.00	2.78	-1.80	3.59	3.95	6.47	6.83	9.70	10.06	12.58
.	.	.	.	.	.	.	.	.	.
.	.	.	.	.	.	.	.	.	.

Note. In the actual calculations, values were not rounded. The calculation for the bolded value = $(0-0/2.78)$

Then, the scores were placed on the normal distribution curve with a specified mean of 0, standard deviation of 1, and the distribution type set to Cumulative Normal Distribution Function. A sample of these values after the normal distribution calculation can be found in Table B-3.

Table B-3. Sample Normally Distributed Values for Math Grade 3 Form 1

Raw Score	Nov Min	Nov Max	App Min	App Max	Prof Min	Prof Max	Dist Min	Dist Max
0	0.50	1.00	1.00	1.00	1.00	1.00	1.00	1.00
1	0.36	1.00	1.00	1.00	1.00	1.00	1.00	1.00
2	0.24	1.00	1.00	1.00	1.00	1.00	1.00	1.00
3	0.14	1.00	1.00	1.00	1.00	1.00	1.00	1.00
4	0.08	1.00	1.00	1.00	1.00	1.00	1.00	1.00
5	0.04	1.00	1.00	1.00	1.00	1.00	1.00	1.00
.	.	.	.	.	.	.	.	.
.	.	.	.	.	.	.	.	.

Note. In the actual calculations, values were not rounded.

Next, the normally distributed values corresponding to the minimum of the raw cut score ranges were subtracted from the respective normally distributed maximum values of the raw cut score ranges (e.g., column 10 – column 0 in Table B-3). The new differences were then multiplied by the number of students who obtained each raw score. A sample of these calculations is provided in Table B-4 below.

Table B-4. Sample Classifications by Raw Score and Performance Classification for Math Grade 3 Form 1

Raw Score	Number of Students	Novice	Apprentice	Proficient	Distinguished
0	12	6.00	<0.01	<0.01	<0.01
1	44	28.18	<0.01	<0.01	<0.01
2	53	40.48	<0.01	<0.01	<0.01
3	51	43.84	<0.01	<0.01	<0.01
4	39	36.06	<0.01	<0.01	<0.01
5	52	50.11	<0.01	<0.01	<0.01
.	.	.	.	.	.
.	.	.	.	.	.

Note. In the actual calculations, values were not rounded. As previously described, the values in the performance classification columns were obtained by multiplying the number of students by the difference in the upper and lower bounds of each raw cut score range.

For each performance classification, summing the values for the corresponding raw cut score range will yield the number of students who were correctly classified into that performance category. For example, for the Novice performance classification, summing the rows in the Novice column corresponding to the raw scores of 0-15 would yield the number of students who were correctly classified as Novice. As an additional example, for the Apprentice performance classification, summing the rows in the Apprentice column corresponding to the raw scores of 16-23 would yield the number of students who were correctly classified as Apprentice.

On the other hand, summing the values in a specific performance classification column corresponding to a different raw cut score range would yield the number of students who were misclassified (i.e., assigned to the column's performance classification but expected to perform according to the raw cut score range). To provide a couple of examples, summing the values in the Novice performance classification column that corresponds to the raw cut score range of 16-23 (i.e., Apprentice) would give the number of students who were assigned to the Novice performance classification but expected to perform at the Apprentice level. Additionally, summing the values in the Apprentice performance classification that correspond to the raw cut score range of 24-32 (i.e., Proficient) gives the number of students who were assigned to the Apprentice performance classification but expected to perform at the Proficient level.

Any of these classifications can be converted to a percentage by dividing by the total number of classifications or the sum of the number of students across each raw score and performance classification. Finally, the total number or percentage of correct classifications can be calculated by summing the number or percentage of correctly classified students in each performance category.
